

Exp- 30:

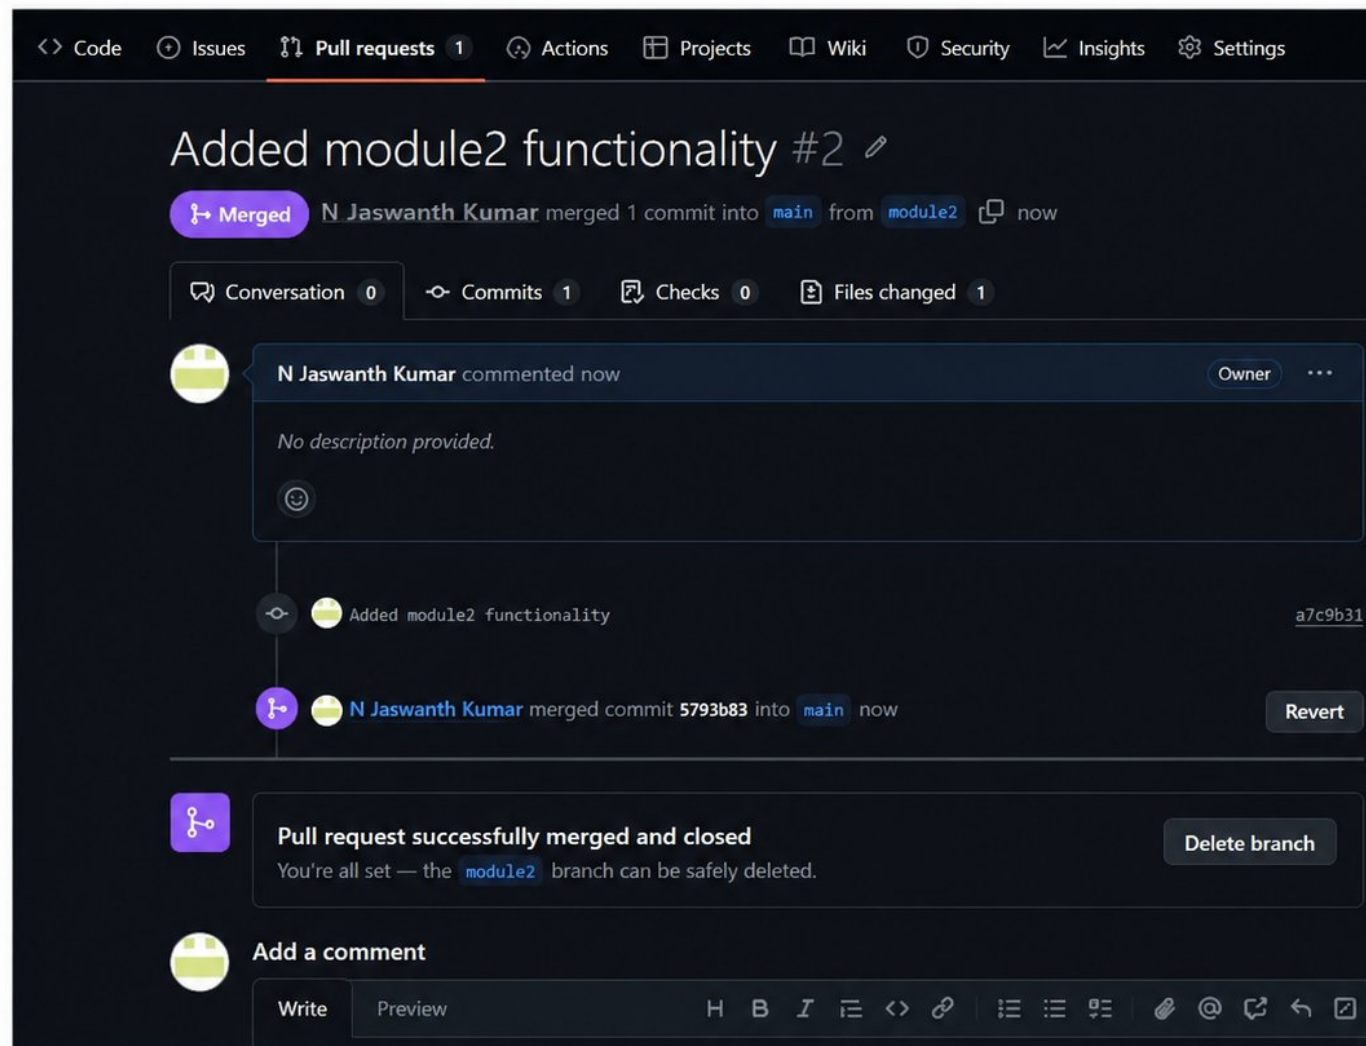

GitHub collaboration workflow

Aim

To fetch the latest changes from a GitHub repository, create a new branch, implement a new feature independently, and manage the changes using Git version control without affecting the existing code.

Procedure

1. Open Visual Studio Code and launch the integrated terminal.
2. Navigate to the existing project repository folder.
3. Pull the latest changes from GitHub using the pull command to update the local repository.
4. Create a new branch for implementing the new feature.
5. Open project files and add or modify the required feature files.
6. Save the changes in the project.
7. Check the repository status to view modified and new files.
8. Stage the modified files using the add command.
9. Commit the changes with an appropriate commit message.
10. Push the new branch to the GitHub repository.
11. Open GitHub and create a Pull Request to merge the feature branch into the main branch.
12. Review and merge the Pull Request after verification.

Result

Thus, the latest project changes were fetched successfully, a new branch was created, the feature was implemented independently, and the changes were integrated into the project using GitHub version control workflow.
